

## ON SOME LINEAR OPERATORS ON FOCK TYPE SPACE

I.KH. MUSIN

**Abstract.** We consider a lower semi-continuous function  $\varphi$  in  $\mathbb{R}^n$  depending on the absolute values of the variables and growing faster than  $a \ln(1 + \|x\|)$  for each positive  $a$ . In terms of this function, we define a Hilbert space  $F_\varphi^2$  of entire functions in  $\mathbb{C}^n$ . This is a natural generalization of a classical Fock space. In this paper we provide an alternative description of the space  $F_\varphi^2$  in terms of the coefficients in the power expansions for the entire functions in this space. We mention simplest properties of reproducing kernels in the space  $F_\varphi^2$ . We consider the orthogonal projector from the space  $L_\varphi^2$  of measurable complex-valued functions  $f$  in  $\mathbb{C}^n$  such that

$$\|f\|_\varphi^2 = \int_{\mathbb{C}^n} |f(z)|^2 e^{-2\varphi(\text{abs } z)} d\mu_n(z) < \infty,$$

where  $z = (z_1, \dots, z_n)$ ,  $\text{abs } z = (|z_1|, \dots, |z_n|)$ , on its closed subspace  $F_\varphi^2$ , and for this projector we obtain an integral representation.

We also obtain an integral formula for the trace of a positive linear continuous operator on the space  $F_\varphi^2$ . By means of this formula we find the conditions, under which a weighted operator of the composition on  $F_\varphi^2$  is a Hilbert-Schmidt operator. Two latter results generalize corresponding results by Sei-Ichiro Ueki, who studied similar questions for operators in Fock space.

**Keywords:** entire functions, Fock type space, linear operators, operator trace, weighted composition operators, Hilbert-Schmidt operator.

**Mathematics Subject Classification:** 32A15, 42B10, 46E22, 47B33

## 1. INTRODUCTION

**1.1. On considered problems.** Let  $H(\mathbb{C}^n)$  be a space of entire functions in  $\mathbb{C}^n$  equipped with a topology of uniform convergence on compact subset  $\mathbb{C}^n$ ,  $d\mu_n$  be the Lebesgue measure in  $\mathbb{C}^n$ ,  $\text{abs } u = (|u_1|, \dots, |u_n|)$  for  $u = (u_1, \dots, u_n) \in \mathbb{R}^n$  ( $\mathbb{C}^n$ ).

By  $V(\mathbb{R}^n)$  we denote the set of lower-semi-continuous function  $v : \mathbb{R}^n \rightarrow \mathbb{R}$  obeying the conditions:

$i_1$ ).  $v(x) = v(\text{abs } x)$ ,  $x \in \mathbb{R}^n$ ;

$i_2$ ).  $\lim_{x \rightarrow \infty} \frac{v(x)}{\ln(1 + \|x\|)} = +\infty$ ;

$i_3$ ). The restriction of  $v$  on  $[0, \infty)^n$  does not decrease in each variable.

Given  $\varphi \in V(\mathbb{R}^n)$ , by  $L_\varphi^2$  we denote the space of measurable functions  $f : \mathbb{C}^n \rightarrow \mathbb{C}$  such that

$$\|f\|_\varphi^2 = \int_{\mathbb{C}^n} |f(z)|^2 e^{-2\varphi(\text{abs } z)} d\mu_n(z) < \infty$$

with the scalar product  $(f, g)_\varphi = \int_{\mathbb{C}^n} f(z) \overline{g(z)} e^{-2\varphi(\text{abs } z)} d\mu_n(z)$ ,  $f, g \in L_\varphi^2$ ; the space  $L_\varphi^2$  is Hilbert.

Let  $F_\varphi^2 = L_\varphi^2 \cap H(\mathbb{C}^n)$ . It is easy to show that  $F_\varphi^2$  is a closed subspace of the space  $L_\varphi^2$ . By Condition  $i_2$ ), the polynomials belong to  $F_\varphi^2$ .

The definition of the space  $F_\varphi^2$  is a natural generalization of the Fock space and it motivates a study of a series of problems related both the theory of functions and the operator theory.

Submitted August 24, 2018.

In the present paper we provide an alternative description of the space  $F_\varphi^2$  and we restrict ourselves by considering an operator of orthogonal projection from  $L_\varphi^2$  into  $F_\varphi^2$  and by finding the conditions under which a weighted composition operator from  $F_\varphi^2$  into  $F_\varphi^2$  is a Hilbert-Schmidt operator.

**1.2. Notations.** Given  $u = (u_1, \dots, u_n)$ ,  $v = (v_1, \dots, v_n) \in \mathbb{R}^n(\mathbb{C}^n)$ , we let  $\langle u, v \rangle := u_1 v_1 + \dots + u_n v_n$ ,  $\|u\|$  is the Euclidean norm in  $u$ .

For  $\varphi \in V(\mathbb{R}^n)$ ,  $\alpha = (\alpha_1, \dots, \alpha_n) \in \mathbb{Z}_+^n$ ,  $z = (z_1, \dots, z_n) \in \mathbb{C}^n$   $|\alpha| := \alpha_1 + \dots + \alpha_n$  is the length of a multi-index  $\alpha$ ,  $\tilde{\alpha} := (\alpha_1 + 1, \dots, \alpha_n + 1)$ ,  $z^\alpha := z_1^{\alpha_1} \dots z_n^{\alpha_n}$ ,

$$c_\alpha(\varphi) := \int_{\mathbb{C}^n} |z_1|^{2\alpha_1} \dots |z_n|^{2\alpha_n} e^{-2\varphi(\text{abs } z)} d\mu_n(z), \quad e_\alpha(z) = \frac{z^\alpha}{\sqrt{c_\alpha(\varphi)}}.$$

Given  $R > 0$ , by  $\Pi_R$  we denote the polydisk  $\{z \in \mathbb{C}^n : |z_1| < R, \dots, |z_n| < R\}$ .

For a function  $u$  with the domain containing the set  $(0, \infty)^n$ , we define a function  $u[e]$  in  $\mathbb{R}^n$  by the rule:  $u[e](x) = u(e^{x_1}, \dots, e^{x_n})$ ,  $x = (x_1, \dots, x_n) \in \mathbb{R}^n$ .

The Young-Fenchel transform of the function  $u : \mathbb{R}^n \rightarrow [-\infty, +\infty]$  is a function  $u^* : \mathbb{R}^n \rightarrow [-\infty, +\infty]$  defined by the formula  $u^*(x) = \sup_{y \in \mathbb{R}^n} (\langle x, y \rangle - u(y))$ ,  $x \in \mathbb{R}^n$ .

Given a Hilbert space  $H$ , by  $(f, g)_H$  we denote the scalar product in  $H$ , while  $\|x\|_H$  stands for the Hilbert norm of an element  $x \in H$ . Instead of  $(f, g)_{F_\varphi^2}$  we write  $(f, g)_\varphi$ .

**1.3. Main results.** Theorem 1 provides a description of entire functions forming the space  $F_\varphi^2$  in terms of the coefficients in their power expansions. The simplest properties of the reproducing kernels of the space  $F_\varphi^2$  are given in Section 2. An explicit form for the orthogonal projector from  $L_\varphi^2$  into  $F_\varphi^2$  is obtained in Theorem 3. In Section 3 we obtain an integral formula for the trace of a linear continuous operator on  $F_\varphi^2$ , see Theorem 4. It is employed in proof of Theorem 5, in which there formulated the conditions, under which a weighted composition operator on  $F_\varphi^2$  is a Hilbert-Schmidt operator. Theorem 5 generalizes the main result of work [2], in which weighted compositions operators were considered in the Fock space. Its proof follows the main line of that of Theorem 1 in [2].

## 2. SPACE $F_\varphi^2$

### 2.1. Preliminaries.

**Proposition.** Let  $\varphi \in V(\mathbb{R}^n)$ . Then

$$(\varphi[e])^*(x) < +\infty \quad \text{for } x \in [0, \infty)^n, \quad \lim_{\substack{x \rightarrow \infty, \\ x \in [0, \infty)^n}} \frac{(\varphi[e])^*(x)}{\|x\|} = +\infty,$$

$$c_\alpha(\varphi) \geq \frac{\pi^n}{\tilde{\alpha}_1 \dots \tilde{\alpha}_n} e^{2(\varphi[e])^*(\tilde{\alpha})}, \quad \alpha \in \mathbb{Z}_+^n.$$

*Proof.* The first statement can be proved by straightforward calculations.

For each  $x \in [0, \infty)^n$  and  $t \in \mathbb{R}^n$  we have  $(\varphi[e])^*(x) \geq \langle x, t \rangle - (\varphi[e])(t)$ . In particular, this implies that for each  $M > 0$

$$(\varphi[e])^*(x) \geq M\|x\| - \varphi[e]\left(\frac{Mx}{\|x\|}\right) \geq M\|x\| - \varphi(e^M, \dots, e^M), \quad x \in [0, \infty)^n \setminus \{0\}.$$

This proves the second statement.

The third statement can be proved by an approach used in the proof of Lemma 2 in [3].  $\square$

**Corollary.** Let  $\varphi \in V(\mathbb{R}^n)$ . Then for each  $M > 0$  there exists a constant  $C_M > 0$  such that  $c_\alpha(\varphi) \geq C_M M^{|\alpha|}$  for each  $\alpha \in \mathbb{Z}_+^n$ .

### 2.2. Orthonormal basis in $F_\varphi^2$ .

**Theorem 1.** Let  $\varphi \in V(\mathbb{R}^n)$  and an entire function  $f(z) = \sum_{|\alpha| \geq 0} a_\alpha z^\alpha$  belongs to  $F_\varphi^2$ . Then

$$\sum_{|\alpha| \geq 0} |a_\alpha|^2 c_\alpha(\varphi) < \infty, \quad \|f\|_\varphi^2 = \sum_{|\alpha| \geq 0} |a_\alpha|^2 c_\alpha(\varphi).$$

Vice versa, let a sequence  $(a_\alpha)_{|\alpha| \geq 0}$  of complex numbers  $a_\alpha$  is such that the series  $\sum_{|\alpha| \geq 0} |a_\alpha|^2 c_\alpha(\varphi)$  converges. Then  $f(z) = \sum_{|\alpha| \geq 0} a_\alpha z^\alpha \in H(\mathbb{C}^n)$  and  $f \in F_\varphi^2$ .

*Proof.* Let  $f(z) = \sum_{|\alpha| \geq 0} a_\alpha z^\alpha \in H(\mathbb{C}^n)$ . The chain of identities

$$\begin{aligned}
\|f\|_\varphi^2 &= \int_{\mathbb{C}^n} |f(z)|^2 e^{-2\varphi(\text{abs } z)} d\mu_n(z) = \lim_{R \rightarrow \infty} \int_{\Pi_R} |f(z)|^2 e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= \lim_{R \rightarrow \infty} \int_{\Pi_R} \sum_{|\alpha| \geq 0} a_\alpha z^\alpha \sum_{|\beta| \geq 0} \bar{a}_\beta \bar{z}^\beta e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= \lim_{R \rightarrow \infty} \sum_{\alpha, \beta \in \mathbb{Z}_+^n} a_\alpha \bar{a}_\beta \int_{\Pi_R} z^\alpha \bar{z}^\beta e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= \lim_{R \rightarrow \infty} \sum_{|\alpha| \geq 0} |a_\alpha|^2 \int_{\Pi_R} |z_1|^{2\alpha_1} \dots |z_n|^{2\alpha_n} e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= \lim_{R \rightarrow \infty} \int_{\Pi_R} \sum_{|\alpha| \geq 0} |a_\alpha|^2 |z_1|^{2\alpha_1} \dots |z_n|^{2\alpha_n} e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= \int_{\mathbb{C}^n} \sum_{|\alpha| \geq 0} |a_\alpha|^2 |z_1|^{2\alpha_1} \dots |z_n|^{2\alpha_n} e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= \sum_{|\alpha| \geq 0} |a_\alpha|^2 \int_{\mathbb{C}^n} |z_1|^{2\alpha_1} \dots |z_n|^{2\alpha_n} e^{-2\varphi(\text{abs } z)} d\mu_n(z) = \sum_{|\alpha| \geq 0} |a_\alpha|^2 c_\alpha(\varphi)
\end{aligned}$$

shows that  $f \in F_\varphi^2$  if and only if  $\sum_{|\alpha| \geq 0} |a_\alpha|^2 c_\alpha(\varphi) < \infty$ .

Vice versa, the convergence of the series  $\sum_{|\alpha| \geq 0} |a_\alpha|^2 c_\alpha(\varphi)$  and Corollary yield that for each  $\varepsilon > 0$  there exists a number  $c_\varepsilon > 0$  such that  $|a_\alpha| \leq c_\varepsilon \varepsilon^{|\alpha|}$  for each  $\alpha \in \mathbb{Z}_+^n$ . This means that  $f(z) = \sum_{|\alpha| \geq 0} a_\alpha z^\alpha$  is an entire function in  $\mathbb{C}^n$ . The above identities imply that  $f \in F_\varphi^2$ .  $\square$

**Lemma 1.** Let  $\varphi \in V(\mathbb{R}^n)$  and an entire function  $f(z) = \sum_{|\alpha| \geq 0} a_\alpha z^\alpha$  belongs to  $F_\varphi^2$ . Then  $(f, e_\alpha)_\varphi = a_\alpha \sqrt{c_\alpha(\varphi)}$  for each  $\alpha \in \mathbb{Z}_+^n$ .

*Proof.* For each  $\alpha \in \mathbb{Z}_+^n$  we have

$$\begin{aligned}
(f, e_\alpha)_\varphi &= \lim_{R \rightarrow \infty} \int_{\Pi_R} f(z) \overline{e_\alpha(z)} e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= \lim_{R \rightarrow \infty} \sum_{|\beta| \geq 0} a_\beta \sqrt{c_\beta(\varphi)} \int_{\Pi_R} e_\beta(z) \overline{e_\alpha(z)} e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= a_\alpha \sqrt{c_\alpha(\varphi)} \lim_{R \rightarrow \infty} \int_{\Pi_R} |e_\alpha(z)|^2 e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\
&= a_\alpha \sqrt{c_\alpha(\varphi)} \int_{\mathbb{C}^n} |e_\alpha(z)|^2 e^{-2\varphi(\text{abs } z)} d\mu_n(z) = a_\alpha \sqrt{c_\alpha(\varphi)}.
\end{aligned}$$

$\square$

**Lemma 2.** Let  $\varphi \in V(\mathbb{R}^n)$ . Then the system  $\{e_\alpha\}_{\alpha \in \mathbb{Z}_+^n}$  is an orthonormal basis in  $F_\varphi^2$ .

*Proof.* The system  $\{e_\alpha\}_{\alpha \in \mathbb{Z}_+^n}$  is orthogonal in  $F_\varphi^2$ . Indeed, for each  $\alpha, \beta \in \mathbb{Z}_+^n : \alpha \neq \beta$  we have

$$\int_{\Pi_R} e_\alpha(z) \overline{e_\beta(z)} e^{-2\varphi(\text{abs } z)} d\mu_n(z) = 0, \quad R > 0,$$

and hence,

$$(e_\alpha, e_\beta)_\varphi = \int_{\mathbb{C}^n} e_\alpha(z) \overline{e_\beta(z)} e^{-2\varphi(\text{abs } z)} d\mu_n(z) = \lim_{R \rightarrow \infty} \int_{\Pi_R} e_\alpha(z) \overline{e_\beta(z)} e^{-2\varphi(\text{abs } z)} d\mu_n(z) = 0.$$

It is obvious that  $\|e_\alpha\|_\varphi = 1$  for each  $\alpha \in \mathbb{Z}_+^n$ .

An orthonormal in  $F_\varphi^2$  system  $\{e_\alpha\}_{\alpha \in \mathbb{Z}_+^n}$  is complete since by Theorem 1 and Lemma 1 for each function  $f(z) = \sum_{|\alpha| \geq 0} a_\alpha z^\alpha \in F_\varphi^2$  we have  $\|f\|_\varphi^2 = \sum_{|\alpha| \geq 0} |(f, e_\alpha)_\varphi|^2$ . Thus, the system  $\{e_\alpha\}_{\alpha \in \mathbb{Z}_+^n}$  forms an orthonormal basis in  $F_\varphi^2$ .  $\square$

**2.3. Reproducing kernels for  $F_\varphi^2$ .** We define a function  $\mathcal{K} : \mathbb{C}^{2n} \rightarrow \mathbb{C}$  by the rule

$$\mathcal{K}(z, w) = \sum_{|\alpha| \geq 0} \frac{z^\alpha w^\alpha}{c_\alpha(\varphi)}, \quad z, w \in \mathbb{C}^n.$$

Since by Corollary for each  $M > 0$  there exists a constant  $C_M > 0$  such that

$$c_\alpha(\varphi) \geq C_M M^{|\alpha|}, \quad \alpha \in \mathbb{Z}_+^n, \quad (1)$$

it is clear that  $\mathcal{K} \in H(\mathbb{C}^{2n})$ .

For  $z \in \mathbb{C}^n$  we define the function  $\mathcal{K}_z : \mathbb{C}^n \rightarrow \mathbb{C}$  by the rule  $\mathcal{K}_z(w) = \mathcal{K}(z, w)$ .

**Lemma 3.** *Let  $\varphi \in V(\mathbb{R}^n)$ ,  $z \in \mathbb{C}^n$ . Then  $\mathcal{K}_z \in F_\varphi^2$ , and  $\|\mathcal{K}_z\|_\varphi^2 = \mathcal{K}(z, \bar{z})$ .*

*Proof.* By  $\nu$  we denote the measure in  $\mathbb{C}^n$  defined by the rule  $d\nu(z) = e^{-2\varphi(\text{abs } z)} d\mu_n(z)$ . Let  $z \in \mathbb{C}^n$ . For each  $R > 0$  we have

$$\begin{aligned} \int_{\Pi_R} |\mathcal{K}_z(w)|^2 d\nu(w) &= \int_{\Pi_R} \sum_{|\alpha| \geq 0} \frac{z^\alpha w^\alpha}{c_\alpha(\varphi)} \sum_{|\beta| \geq 0} \frac{\bar{z}^\beta \bar{w}^\beta}{c_\beta(\varphi)} d\nu(w) \\ &= \sum_{\alpha, \beta \in \mathbb{Z}_+^n} \frac{z^\alpha}{c_\alpha(\varphi)} \frac{\bar{z}^\beta}{c_\beta(\varphi)} \int_{\Pi_R} w^\alpha \bar{w}^\beta d\nu(w) = \sum_{|\alpha| \geq 0} \frac{|z^\alpha|^2}{c_\alpha^2(\varphi)} \int_{\Pi_R} |w^\alpha|^2 d\nu(w) \\ &= \int_{\Pi_R} \sum_{|\alpha| \geq 0} \frac{|z^\alpha|^2 |w^\alpha|^2}{c_\alpha^2(\varphi)} d\nu(w). \end{aligned}$$

Therefore,

$$\begin{aligned} \|\mathcal{K}_z\|_\varphi^2 &= \int_{\mathbb{C}^n} |\mathcal{K}_z(w)|^2 d\nu(w) = \lim_{R \rightarrow \infty} \int_{\Pi_R} \sum_{|\alpha| \geq 0} \frac{|z^\alpha|^2 |w^\alpha|^2}{c_\alpha^2(\varphi)} d\nu(w) \\ &= \int_{\mathbb{C}^n} \sum_{|\alpha| \geq 0} \frac{|z^\alpha|^2 |w^\alpha|^2}{c_\alpha^2(\varphi)} d\nu(w) = \sum_{|\alpha| \geq 0} \frac{|z^\alpha|^2}{c_\alpha^2(\varphi)} \int_{\mathbb{C}^n} |w^\alpha|^2 d\nu(w) = \sum_{|\alpha| \geq 0} \frac{|z^\alpha|^2}{c_\alpha(\varphi)}. \end{aligned}$$

Thus,  $\mathcal{K}_z \in F_\varphi^2$  since by inequality (1) the series  $\sum_{|\alpha| \geq 0} \frac{|z^\alpha|^2}{c_\alpha(\varphi)}$  converges uniformly on compact subsets in  $\mathbb{C}^n$  and  $\|\mathcal{K}_z\|_\varphi^2 = \mathcal{K}(z, \bar{z})$ .  $\square$

**Lemma 4.** *Let  $\varphi \in V(\mathbb{R}^n)$ . Then for all  $\alpha \in \mathbb{Z}_+^n$  and  $z \in \mathbb{C}^n$  the identities hold*

$$(e_\alpha, \mathcal{K}_{\bar{z}})_\varphi = \int_{\mathbb{C}^n} e_\alpha(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w) = e_\alpha(z).$$

*Proof.* Let  $\alpha \in \mathbb{Z}_+^n$  and  $z \in \mathbb{C}^n$ . Then for each  $R > 0$

$$\begin{aligned} \int_{\Pi_R} e_\alpha(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w) &= \int_{\Pi_R} e_\alpha(w) \sum_{|\beta| \geq 0} e_\beta(z) \overline{e_\beta(w)} e^{-2\varphi(\text{abs } w)} d\mu_n(w) \\ &= \sum_{|\beta| \geq 0} e_\beta(z) \int_{\Pi_R} e_\alpha(w) \overline{e_\beta(w)} e^{-2\varphi(\text{abs } w)} d\mu_n(w) \end{aligned}$$

$$= e_\alpha(z) \int_{\Pi_R} |e_\alpha(w)|^2 e^{-2\varphi(\text{abs } w)} d\mu_n(w).$$

We obtain that

$$\begin{aligned} \int_{\mathbb{C}^n} e_\alpha(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w) &= \lim_{R \rightarrow \infty} \int_{\Pi_R} e_\alpha(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w) \\ &= e_\alpha(z) \lim_{R \rightarrow \infty} \int_{\Pi_R} |e_\alpha(w)|^2 e^{-2\varphi(\text{abs } w)} d\mu_n(w) \\ &= e_\alpha(z) \int_{\mathbb{C}^n} |e_\alpha(w)|^2 e^{-2\varphi(\text{abs } w)} d\mu_n(w) = e_\alpha(z). \end{aligned}$$

□

**Theorem 2.** Let  $\varphi \in V(\mathbb{R}^n)$ . Then for each  $f \in F_\varphi^2$

$$f(z) = \int_{\mathbb{C}^n} f(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w), \quad z \in \mathbb{C}^n.$$

*Proof.* Let  $f \in F_\varphi^2$ . For each  $z \in \mathbb{C}^n$  we have

$$\begin{aligned} \int_{\mathbb{C}^n} f(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w) &= (f, \mathcal{K}_{\bar{z}})_\varphi = \left( \sum_{|\alpha| \geq 0} (f, e_\alpha)_\varphi e_\alpha, \mathcal{K}_{\bar{z}} \right)_\varphi \\ &= \sum_{|\alpha| \geq 0} (f, e_\alpha)_\varphi (e_\alpha, \mathcal{K}_{\bar{z}})_\varphi = \sum_{|\alpha| \geq 0} (f, e_\alpha)_\varphi e_\alpha(z) = f(z). \end{aligned}$$

□

**Remark 1.** For each  $f \in F_\varphi^2$ , thanks to the plurisubharmonicity of  $|f|^2$  we have

$$|f(z)|^2 \leq \frac{1}{\nu_n(1)} \int_{\|w-z\| \leq 1} |f(w)|^2 d\mu_n(w), \quad z \in \mathbb{C}^n,$$

where  $\nu_n(1)$  is the volume of the unit ball in  $\mathbb{C}^n$ . Therefore,

$$|f(z)|^2 \leq \frac{1}{\nu_n(1)} \exp\left(\sup_{\|w-z\| \leq 1} 2\varphi(\text{abs } w)\right) \|f\|_\varphi^2. \quad (2)$$

By estimate (2), for each  $z \in \mathbb{C}^n$ , a linear functional  $\delta_z : F_\varphi^2 \rightarrow \mathbb{C}$  acting by the rule  $\delta_z(f) = f(z)$  is continuous and therefore, there exists the unique function  $K_z \in F_\varphi^2$  such that for each  $f \in F_\varphi^2$  we have  $f(z) = (f, K_z)_\varphi$ . The functions  $K_z$  ( $z \in \mathbb{C}^n$ ) are called reproducing kernels for  $F_\varphi^2$ . At that,  $K_z(w) = \mathcal{K}(\bar{z}, w) = \mathcal{K}_{\bar{z}}(w)$ . In particular, this implies that  $\|K_z\|_\varphi^2 = \mathcal{K}(z, \bar{z})$ .

### 3. SPECIAL CLASSES OF LINEAR OPERATORS ON $F_\varphi^2$

#### 3.1. Orthogonal projector on $F_\varphi^2$ .

**Theorem 3.** Let  $\varphi \in V(\mathbb{R}^n)$ ,  $P_\varphi : L_\varphi^2 \rightarrow F_\varphi^2$  be an orthogonal projector. Then

$$P_\varphi(f)(z) = \int_{\mathbb{C}^n} f(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w), \quad z \in \mathbb{C}^n. \quad (3)$$

*Proof.* Let  $f \in L_\varphi^2$ , then  $P_\varphi(f)$  can be represented as the series  $P_\varphi(f) = \sum_{|\alpha| \geq 0} (f, e_\alpha)_\varphi e_\alpha$  converging in

$F_\varphi^2$ . For each  $z \in \mathbb{C}^n$  we have

$$\begin{aligned} P_\varphi(f)(z) &= \sum_{|\alpha| \geq 0} (f, e_\alpha)_\varphi e_\alpha(z) = (f, \sum_{|\alpha| \geq 0} \overline{e_\alpha(z)} e_\alpha)_\varphi \\ &= (f, \mathcal{K}_{\bar{z}})_\varphi = \int_{\mathbb{C}^n} f(w) \mathcal{K}(z, \bar{w}) e^{-2\varphi(\text{abs } w)} d\mu_n(w). \end{aligned}$$

□

**Remark 2.** Identity (3) can be written as  $P_\varphi(f)(z) = (f, K_z)_\varphi$ .

### 3.2. Trace of positive linear continuous operator on $F_\varphi^2$ .

**Definition 1.** A linear continuous operator  $A$  on a Hilbert space  $H$  is called positive if  $(Ax, x)_H \geq 0$  for each  $x \in H$ .

It is known [4, 12.32, Thm.] that a positive linear continuous operator  $A$  on a Hilbert space  $H$  is self-adjoint.

**Definition 2.** Let  $H$  be a Hilbert space,  $A$  be a positive linear continuous operator in  $H$  and  $\{\psi_k\}_{k \in \mathbb{N}}$  be an orthonormalized basis in  $H$ . The trace  $\text{tr}(A)$  of the operator  $A$  is defined as  $\text{tr}(A) = \sum_{k=1}^{\infty} (A(\psi_k), \psi_k)_H$ .

It is known [5, Lms. 5.6.2, 5.5.1] that the definition of the trace of an operator  $A$  is independent on the basis in  $H$ .

**Theorem 4.** Let  $A$  be a positive linear continuous operator on  $F_\varphi^2$ . Then

$$\text{tr}(A) = \int_{\mathbb{C}^n} (A(K_z), K_z)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z).$$

*Proof.* We have

$$\begin{aligned} \int_{\mathbb{C}^n} (A(K_z), K_z)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) &= \lim_{R \rightarrow \infty} \int_{\Pi_R} (A(K_z), K_z)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \lim_{R \rightarrow \infty} \int_{\Pi_R} (A(\sum_{|\alpha| \geq 0} \overline{e_\alpha(z)} e_\alpha), \sum_{|\beta| \geq 0} \overline{e_\beta(z)} e_\beta)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \lim_{R \rightarrow \infty} \int_{\Pi_R} \sum_{\alpha, \beta \in \mathbb{Z}_+^n} \overline{e_\alpha(z)} e_\beta(z) (A(e_\alpha), e_\beta)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \lim_{R \rightarrow \infty} \sum_{\alpha, \beta \in \mathbb{Z}_+^n} \int_{\Pi_R} \overline{e_\alpha(z)} e_\beta(z) (A(e_\alpha), e_\beta)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \lim_{R \rightarrow \infty} \sum_{|\alpha| \geq 0} \int_{\Pi_R} |e_\alpha(z)|^2 (A(e_\alpha), e_\alpha)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \lim_{R \rightarrow \infty} \int_{\Pi_R} \sum_{|\alpha| \geq 0} |e_\alpha(z)|^2 (A(e_\alpha), e_\alpha)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \int_{\mathbb{C}^n} \sum_{|\alpha| \geq 0} |e_\alpha(z)|^2 (A(e_\alpha), e_\alpha)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \sum_{|\alpha| \geq 0} (A(e_\alpha), e_\alpha)_\varphi \int_{\mathbb{C}^n} |e_\alpha(z)|^2 e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \sum_{|\alpha| \geq 0} (A(e_\alpha), e_\alpha)_\varphi = \text{tr}(A). \end{aligned}$$

□

**Remark 3.** We note that a trace formula of such kind for a positive linear continuous operator in the Bergman space on the unit circle was provided in work [1], see Proposition 6.3.2, while for the case of a Fock space of the functions of many variables it was given in work [2], see Lemma 1.

### 3.3. Weighted composition operator on $F_\varphi^2$ .

**Definition 3.** Let  $H$  be a Hilbert space and  $\{\psi_k\}_{k \in \mathbb{N}}$  be an orthonormalized basis in  $H$ . A linear continuous operator  $A : H \rightarrow H$  is called a Hilbert-Schmidt operator if  $\sum_{k=1}^{\infty} \|A(\psi_k)\|_H^2 < \infty$ .

It is known [5, Lm. 5.5.1] that sum of the series is independent on the basis in  $H$ .

**Theorem 5.** *Let a holomorphic mapping  $h : \mathbb{C}^n \rightarrow \mathbb{C}^n$  and a function  $u \in H(\mathbb{C}^n)$  are such that the linear operator  $uC_h : f \in F_\varphi^2 \rightarrow u(f \circ h)$  is continuous on  $F_\varphi^2$ . Then the following conditions are equivalent:*

- 1)  $uC_h$  is a Hilbert-Schmidt operator;
- 2)  $\int_{\mathbb{C}^n} |u(z)|^2 \mathcal{K}(h(z), \overline{h(z)}) e^{-2\varphi(\text{abs } z)} d\mu_n(z) < \infty$ .
- 3)  $\int_{\mathbb{C}^n} \left( \int_{\mathbb{C}^n} |u(w)|^2 |K_z(h(w))|^2 e^{-2(\varphi(\text{abs } w) + \varphi(\text{abs } z))} d\mu_n(w) \right) d\mu_n(z) < \infty$ .

*Proof.* Conditions 1) and 2) are equivalent. Indeed, since

$$\begin{aligned} \sum_{|\alpha| \geq 0} \|uC_h(e_\alpha)\|_\varphi^2 &= \sum_{|\alpha| \geq 0} \int_{\mathbb{C}^n} |u(z)|^2 \frac{|h_1(z)|^{2\alpha_1} \dots |h_n(z)|^{2\alpha_n}}{c_\alpha(\varphi)} e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \int_{\mathbb{C}^n} |u(z)|^2 \sum_{|\alpha| \geq 0} \frac{|h_1(z)|^{2\alpha_1} \dots |h_n(z)|^{2\alpha_n}}{c_\alpha(\varphi)} e^{-2\varphi(\text{abs } z)} d\mu_n(z) \\ &= \int_{\mathbb{C}^n} |u(z)|^2 \mathcal{K}(h(z), \overline{h(z)}) e^{-2\varphi(\text{abs } z)} d\mu_n(z), \end{aligned}$$

the operator  $uC_h$  is Hilbert-Schmidt if and only if

$$\int_{\mathbb{C}^n} |u(z)|^2 \mathcal{K}(h(z), \overline{h(z)}) e^{-2\varphi(\text{abs } z)} d\mu_n(z) < \infty.$$

Let us show that Conditions 1) and 3) are also equivalent. It is obvious that the operator  $uC_h$  on  $F_\varphi^2$  is Hilbert-Schmidt if and only if the trace of the operator  $(uC_h)^* uC_h$  is finite. By Theorem 4, this is true if and only if

$$\int_{\mathbb{C}^n} ((uC_h)^* uC_h(K_z), K_z)_\varphi e^{-2\varphi(\text{abs } z)} d\mu_n(z) < \infty.$$

And since

$$\begin{aligned} ((uC_h)^* uC_h(K_z), K_z)_\varphi &= (uC_h(K_z), uC_h(K_z))_\varphi \\ &= \int_{\mathbb{C}^n} |u(w)|^2 |K_z(h(w))|^2 e^{-2\varphi(\text{abs } w)} d\mu_n(w), \end{aligned}$$

then  $uC_h$  on  $F_\varphi^2$  is a Hilbert-Schmidt operator if and only if

$$\int_{\mathbb{C}^n} \left( \int_{\mathbb{C}^n} |u(w)|^2 |K_z(h(w))|^2 e^{-2(\varphi(\text{abs } w) + \varphi(\text{abs } z))} d\mu_n(w) \right) d\mu_n(z) < \infty.$$
